# How to make a code manual

---

## CMD command

To make a code first you need to understand the 2 types of code:

1. Just execute 1 code
2. Execute 2 or more code

So, in this document you are going to understand all the types to create a code

# CMD type 1

To execute 1 code just type in the prompt the command like this:

```
echo Hello World!
```

But if you execute and create command you need to use the type 2 structure.

# CMD type 2

If you execute 2 or more command, you need to use an array structure with () in the start and the end of the command like this:

```
([“echo Hello World”, “help”])
```
